1	Introduction	1
2	The formation of caustics in two and three dimensional media	7
2.1	Introduction	7
2.2	Theory	8
2.2.1	General theory	8
2.2.2	A medium with 1-D slowness perturbations	10
2.2.3	Gaussian random media	11
2.3	Numerical examples	15
2.4	Conclusions	19
2.5	Appendix A: Derivation of Eq. (2.22)	20
2.6	Appendix B: Caustic formation in three dimensions	22
3	The effect of small-scale heterogeneity on the arrival time of waves	25
3.1	Introduction	25
3.2	Theory	27
3.2.1	The width of Fresnel zones	27
3.2.2	Estimation of caustics in 2-D slowness perturbation fields	28
3.2.3	Timeshift derivations	30
3.3	Setup of the numerical experiment	35
3.4	Results	39
3.5	Application of the regime of scattering theory	43
3.6	Conclusions	44
3.7	Appendix A: The width of Fresnel zones on a sphere	47
4	A test of ray theory and scattering theory based on a laboratory experiment using ultrasonic waves and numerical simulations by finite-difference method	49
4.1	Introduction	50
4.2	Theory	51
4.2.1	Ray theory	52
4.2.2	Scattering theory	53
4.3	Setup of the 3-D laboratory experiment	56

4.4	Auto-correlation function for Westerly and Oshima granite	58
4.5	2-D numerical experiment to test the stochastic scattering approach	60
4.6	Results	63
4.7	Discussion	68
4.8	Conclusions	69
4.9	Appendix A: Analytical integration over a constant frequency-band	73
4.10	Appendix B: The MS-value of timeshift fluctuations using scattering theory in a homogeneous slowness perturbation medium	73
4.11	Appendix C: The converging of the MS-value of time shift fluctuations towards zero when the correlation length goes to zero	74
5	The effect of scattering in surface wave tomography	77
5.1	Introduction	78
5.2	Theory	79
5.2.1	The width of Fresnel zones on the sphere	79
5.2.2	Phase and group velocity maps using ray theory	80
5.2.3	Phase and group velocity maps using scattering theory	81
5.2.4	The properties of the scattering sensitivity kernels	85
5.3	Setup of the surface wave experiment	89
5.4	Results	90
5.5	Discussion	92
5.6	Conclusions	96
5.7	Appendix A: Perturbation theory of the propagation length of scattered ray paths, the width of the Fresnel zone and the geometrical factor	100
5.8	Appendix B: The scattering sensitivity kernel for major arcs	102
5.9	Appendix C: Rotation of scattering sensitivity kernels	103
6	The practical implementation of spectral leakage theory in global surface wave tomography	105
6.1	Introduction	105
6.2	Theory	107
6.3	Spectral leakage theory in global surface wave tomography	109
6.4	Phase velocity maps from the spectral leakage inversion of relative phase-shifts	112
6.5	Discussion and conclusions	118
6.6	Appendix A: The comparison of the phase velocity maps from the undamped spectral leakage inversion and the common undamped least squares inversion	120
	Summary and conclusions	123
	Nederlandse samenvatting	127
	Resumé på Dansk	131
